Buildings

Siemens Smart Infrastructure

A large, stylized graphic on the right side of the slide, featuring a large 'X' shape. The top-left arm of the 'X' shows a modern building facade. The top-right arm shows vibrant purple and blue light streaks. The bottom-left arm shows a dense green forest with sunlight filtering through the trees. The bottom-right arm shows a woman with dark curly hair, wearing a blue turtleneck, looking at a smartphone.

SIEMENS

Shifting the operational paradigm

From ...

To ...

Complex integration
of new technologies

On-site management solutions

Siloed control of building services

Reactive on-site maintenance

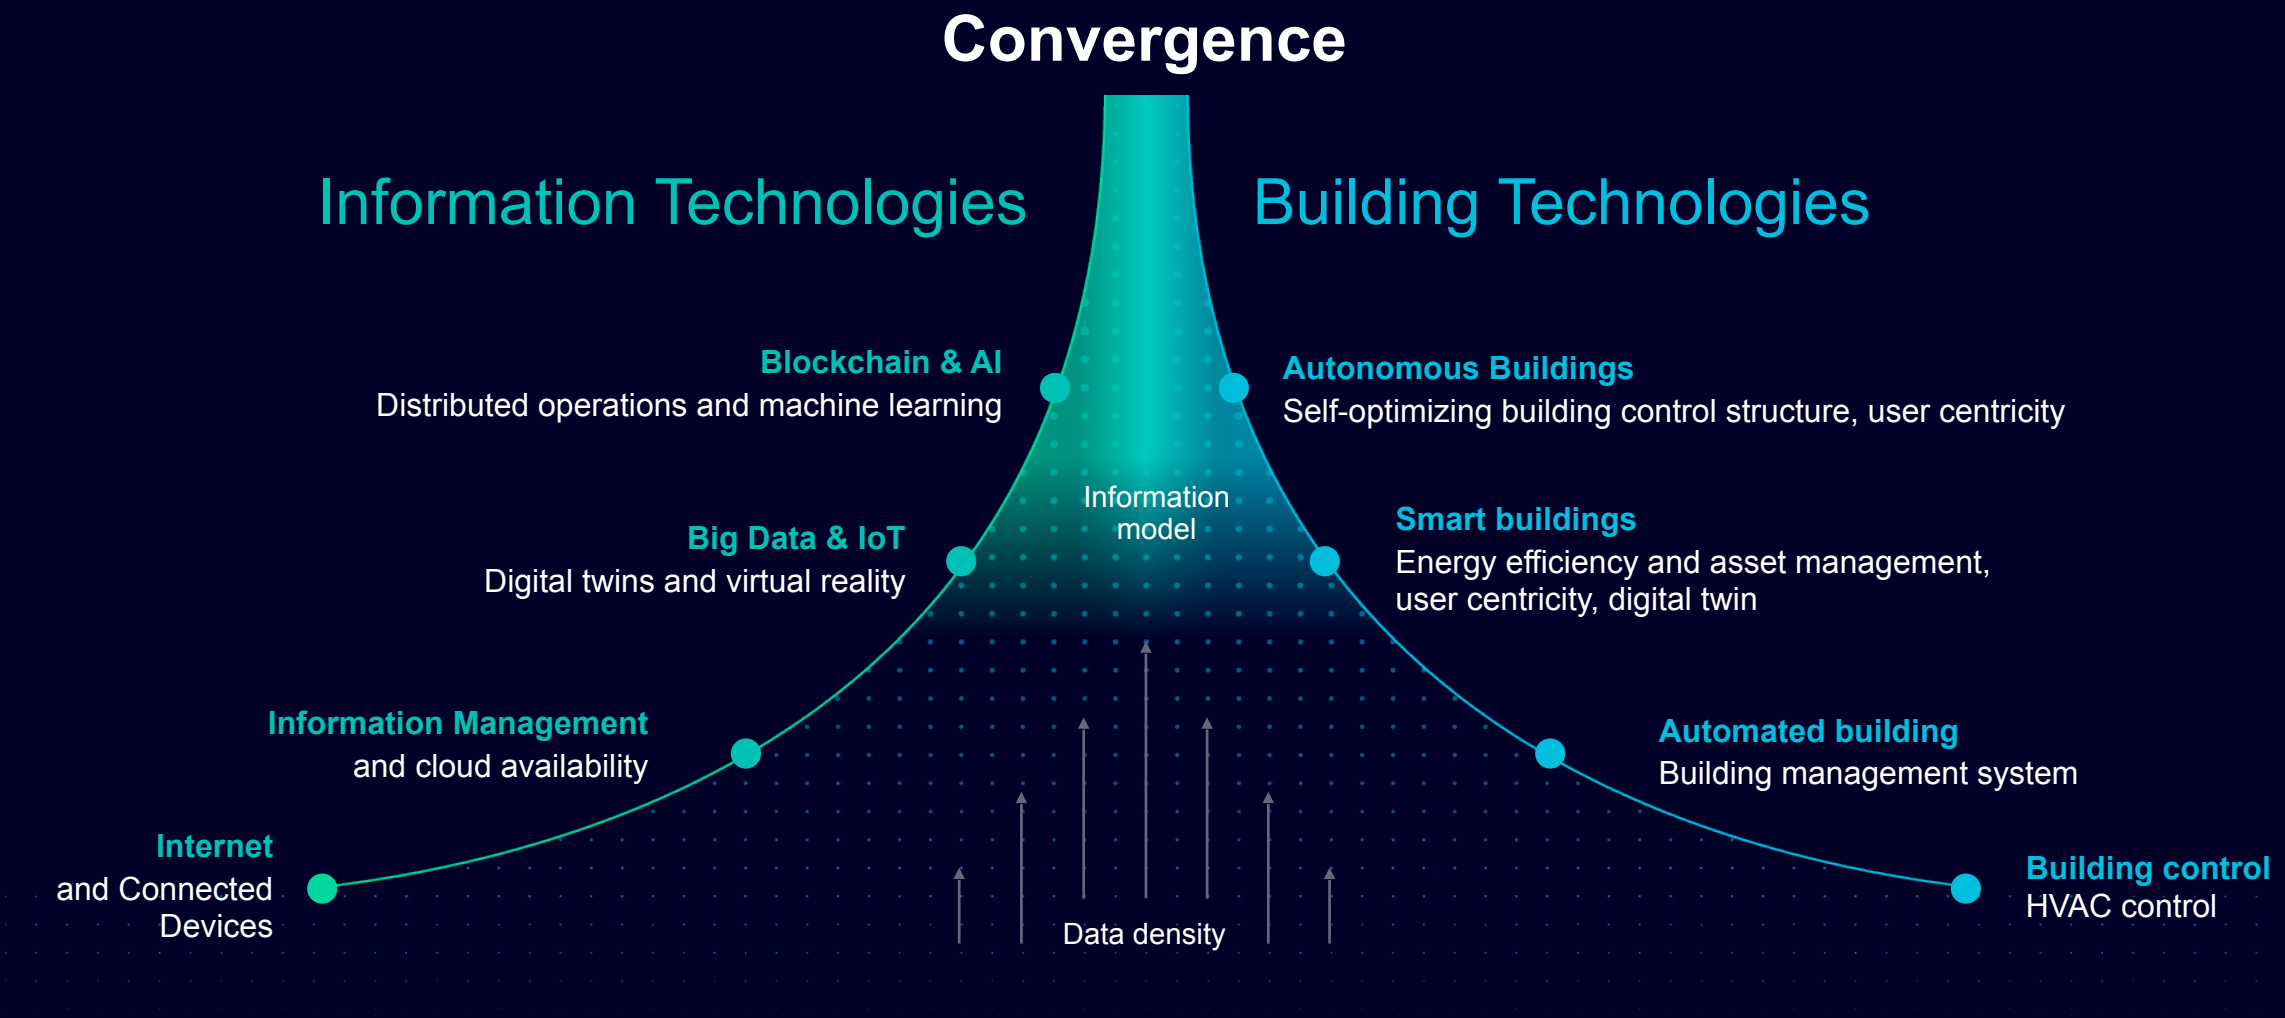

Predictive & prescriptive maintenance

as-a-Service models

AI-enabled remote
operations

Simple & easy integration of new tech

It is all about data ...

The world is changing- Hybrid threats are emerging

Transform your operations of data centers with Building X

Macro Challenges

The Ramifications of Low Digitalization

Real estate owner's reality

No total picture of asset history ●

Multiple systems to access data ●

No connectivity between OT and IT ●

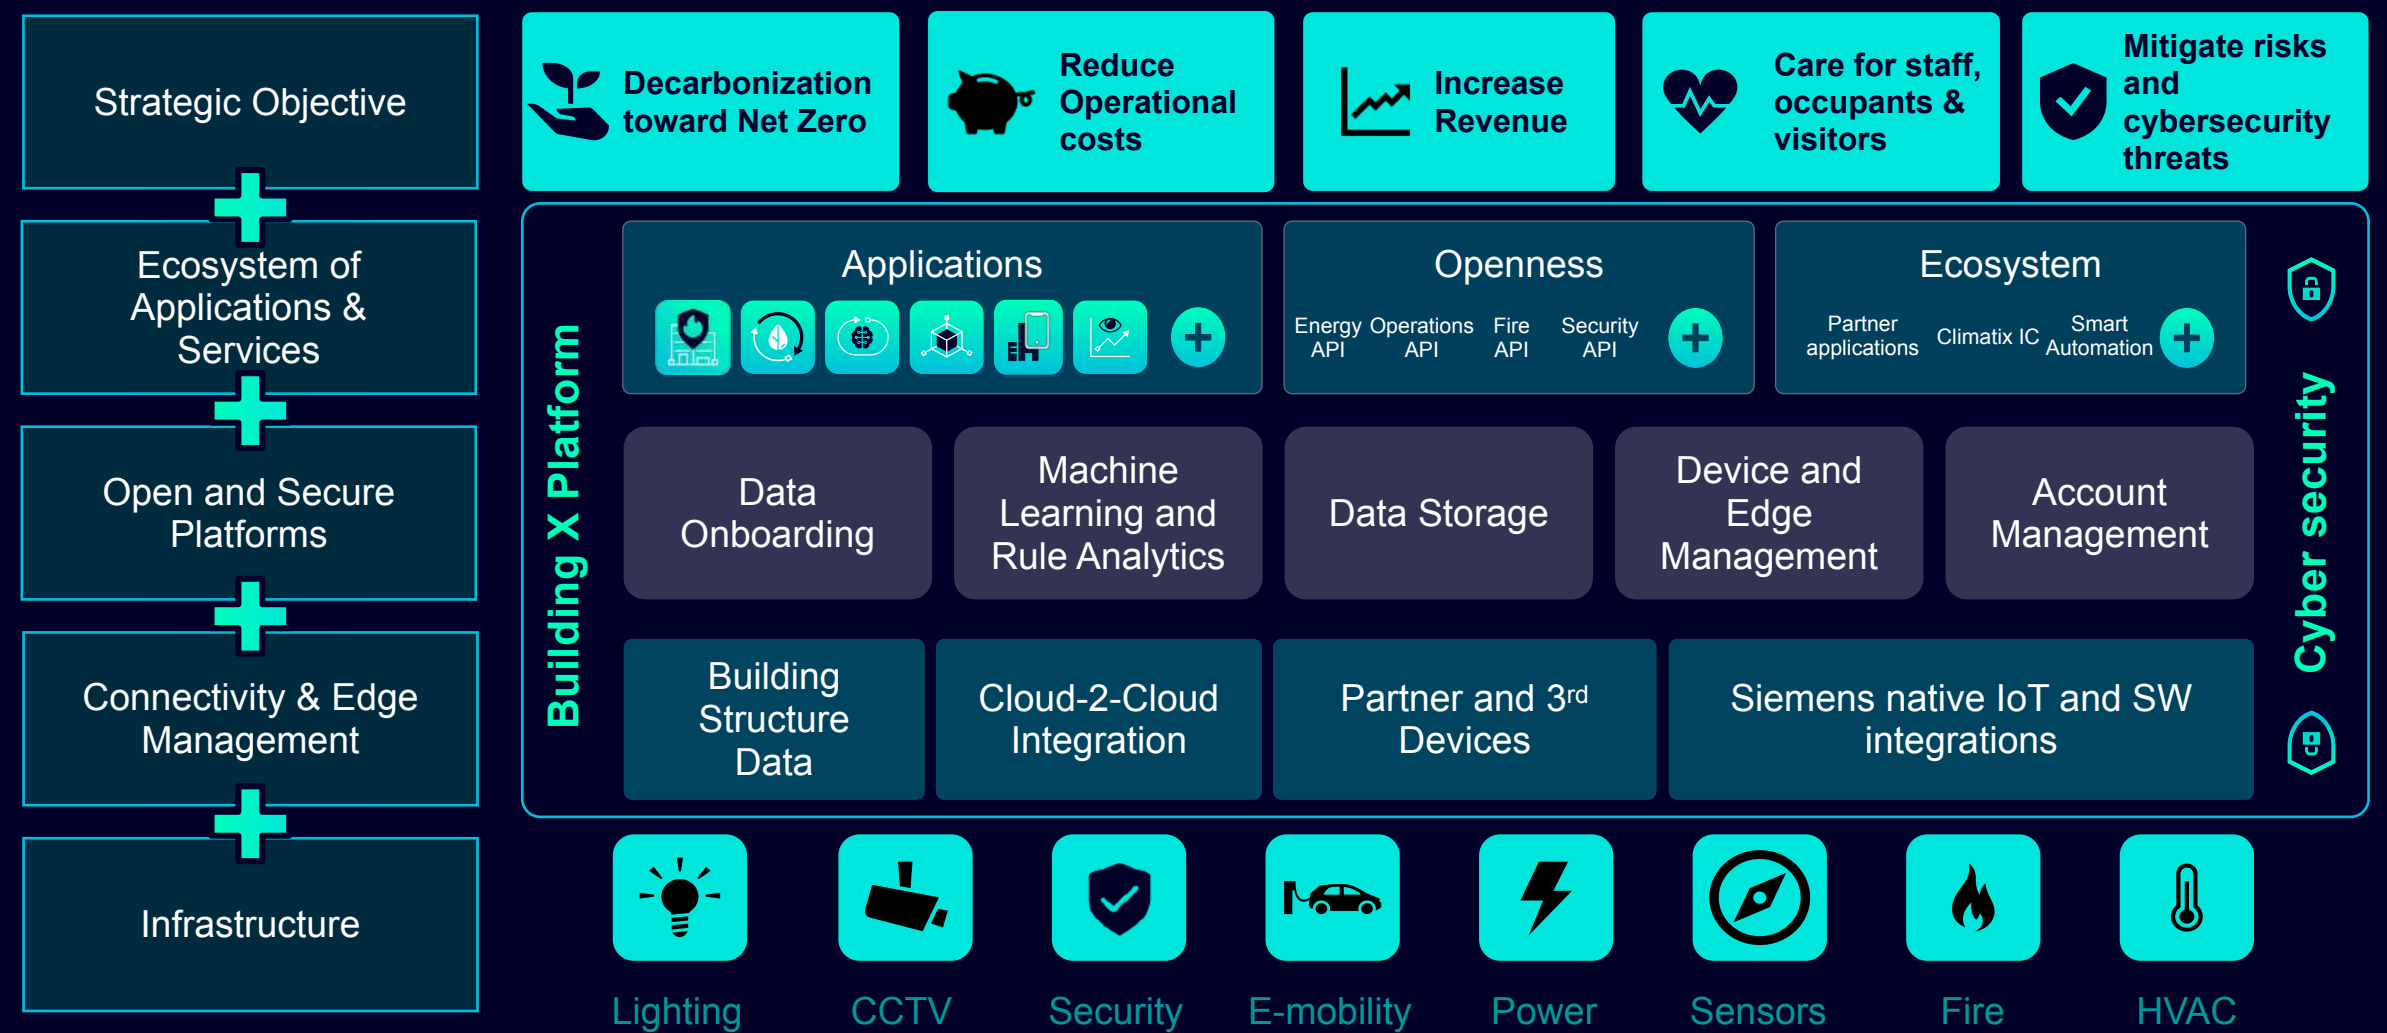

● FM don't know BIM modelling

● Information is siloed and inaccessible

Connected Systems Collaborating:
System Architecture with **Building X** Enables Smarter Buildings

Hybrid security risks and challenges in data centers

Unauthorized access

- Tailgating and other malicious and unauthorized movements inside the facility
- Misguided employees might enter restricted parts of the building causing unintended harm
- Identity theft & social engineering can lead to unauthorized access

Regulatory compliance

- CER Directive: Critical infrastructure resilience at EU-level
- GDPR and other privacy regulations
- CRA: Cyber resilience act
- NIS2 Directive: new rules on cybersecurity of network and information systems
- Data center standards: ANSI/TIA-942, ISO/IEC 27001, SAAE 16, PCI DSS, NIST 800-53, FISMA, HIPAA

Avoid downtime

- Tampering with the power supply due to unauthorized access can lead to unwanted downtimes
- Unsupervised facilities can exacerbate insider threats
- Slow reaction to incidents may lead to unintended downtimes or escalations of security threats
- Without redundancy and backup systems, equipment can be compromised by both accidental and deliberate attacks

Cybersecurity threats

- Unmaintained security systems compromise cybersecurity
- Insecure integration of IP addressable OT hardware can lead to potential vulnerabilities
- Without regular audits and logs of all access to the data center potential vulnerabilities and breaches might not be detected

A hybrid security strategy is key

Physical security is the first line of defense in a data center. Siemens provides a **multi-layered approach** with advanced video surveillance, high-security access control (on-premise or cloud-based), intrusion detection, and centralized security management Siveillance and Building X security portfolio.

With Security as a Service and Physical Security Information Management (PSIM), we enable real-time monitoring, rapid threat response, and seamless integration across all security layers – protecting your data, infrastructure, and operations.

Video surveillance

- Surveillance Video

On-premise access control for high-security environments

- SIPORT
- SiPass integrated

Intrusion detection and perimeter protection

- Siveillance Intrusion
- Siveillance Perimeter

Physical Security Information Mgmt. (PSIM)

- Siveillance Control
- Siveillance Control Pro
- Desigo CC

Security operations app

- Building X Security Manager
- Building X Access mobile app

Security Services

- Security as a Service
- Security Predictive and Manage
- Access rights review
- False alarm detection & diagnosis

Defense in depth

Hybrid security strategy

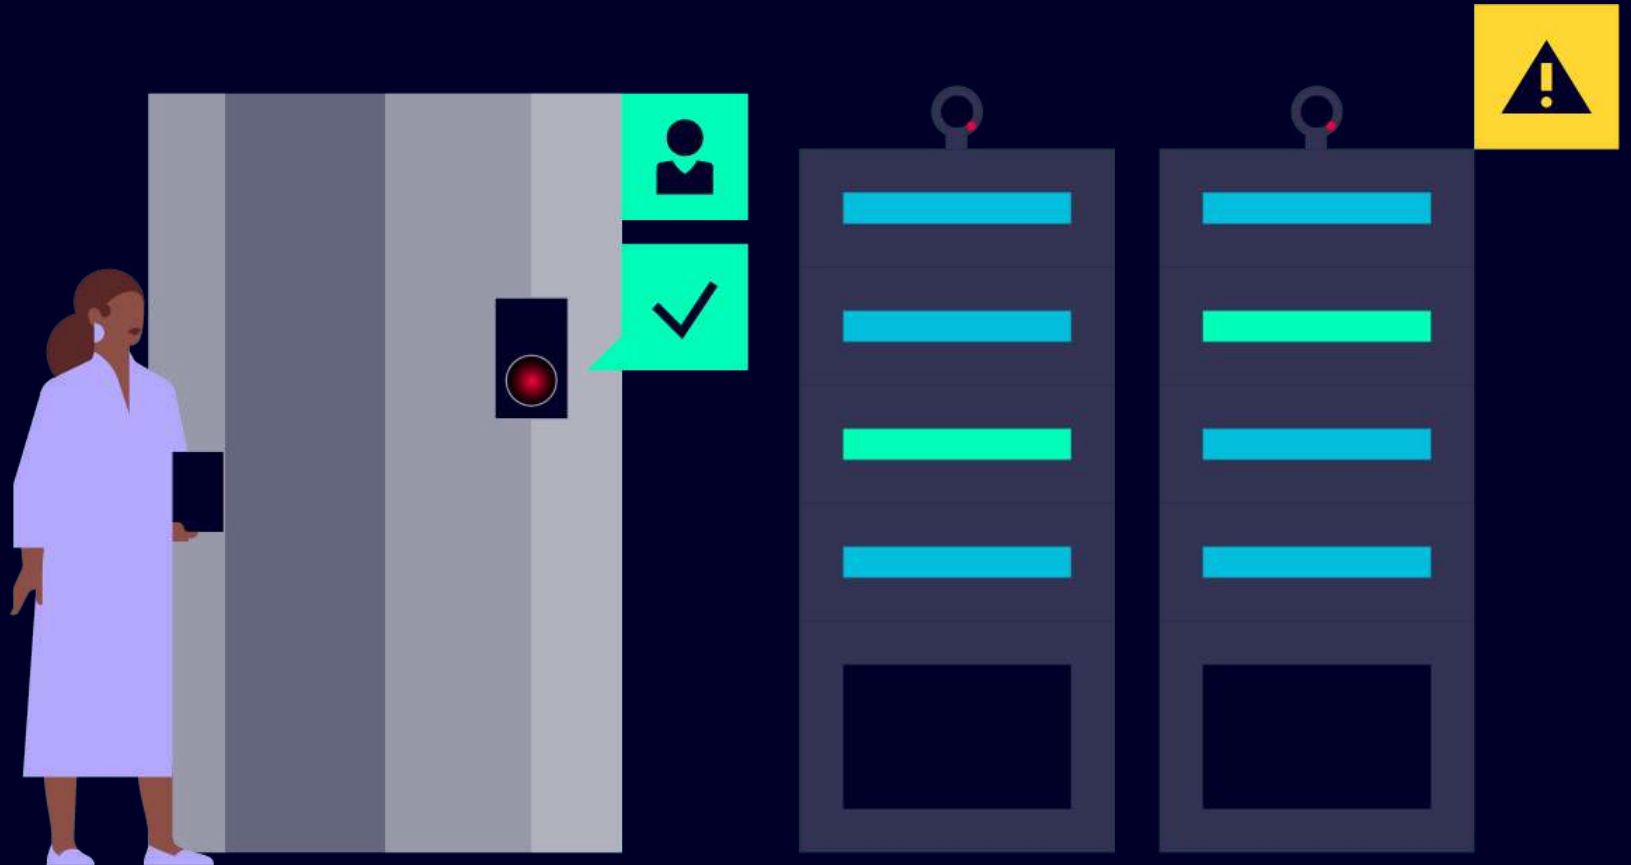

C: Server room layer

Use case: Entering the white space

A QR code is required at the entry point to the server room, followed by facial recognition. If successful, the employee or visitor is granted access.

Should a server rack door be left open, an alarm is triggered to notify data center personnel.

Access across multiple systems is managed via Active directory integration.

D: Server rack layer

Use case: Access to grey spaces

Enter credentials (e.g. RFID card, mobile phone, biometrics, keypads) to access any rack.
Users can request access for a limited time period based on a need to have principle.

An alarm is triggered to indicate that a server rack door is left open, and it must be closed before accessing another rack
